

TESS (Transiting Exoplanet Survey Satellite) - NASA Science

NASA's TESS discovers exoplanets, worlds beyond our solar system. In the course of its extended observations of the sky, TESS also finds and monitors all types of objects that change in brightness, from nearby asteroids to pulsating stars and distant galaxies containing supernovae.

TESS's Dazzling Night Sky

The TESS mission has released its most complete view of the starry sky to date. Nearly 6,000 colored dots scattered across the image show the locations of either confirmed or candidate exoplanets — worlds beyond our solar system — identified by the mission as of September 2025 at the end of TESS's second extended mission.
