

Artemis

Under Artemis, NASA will send astronauts on increasingly difficult missions to explore more of the Moon for scientific discovery, economic benefits, and to build on our foundation for the first crewed missions to Mars.

QUICK FACTS

Artemis II, the first crewed Artemis flight, marks a key step toward long-term return to the Moon and future missions to Mars.

Strengthening Artemis

To achieve the national goal of landing American astronauts on the surface of the Moon and maintaining U.S. superiority in exploration and discovery, NASA is increasing its cadence of missions under the Artemis program, standardizing the SLS (Space Launch System) rocket configuration, and adding a new mission.

Meet Artemis III

Lunar Exploration

The Moon is a 4.5-billion-year-old time capsule.

We're going back to the Moon for scientific discovery, economic benefits, and inspiration for a new generation of explorers. While maintaining American leadership in exploration,

we will build a global alliance and explore deep space for the benefit of all.

Missions

Artemis I

Launched in 2022, Artemis I was the first in a series of increasingly complex missions that will enable human exploration at the Moon and future missions to Mars.

Artemis II

The first crewed Artemis flight marks a key step toward long-term return to the Moon and future missions to Mars.

Artemis III

Scheduled for 2027, this new demonstration mission in low Earth orbit will test one or both commercial landers from SpaceX and Blue Origin, respectively.

Artemis IV

NASA continues to target early 2028 for the first Artemis lunar landing, a date that has remained unchanged since mid-2025. After reaching lunar orbit, the crew will transfer from Orion to a commercial lunar lander for their descent to the Moon's surface.

Artemis V

Using the standard SLS (Space Launch System) rocket configuration, NASA expects to launch this lunar surface mission by late 2028, with subsequent missions planned roughly once per year.

Our Artemis II Crew

Meet the astronauts who ventured around the Moon on Artemis II, the first crewed flight aboard NASA's human deep space capabilities, paving the way for future lunar surface missions.

Carrying Humanity to the Moon

Orion is developed to be capable of sending astronauts to the Moon and is a crucial step toward eventually sending crews on to Mars.

The Orion spacecraft will serve as the exploration vehicle that will carry and sustain the crew on Artemis missions to the Moon and return them safely to Earth. Orion will launch on NASA's new heavy-lift rocket, the SLS (Space Launch System).

The Artemis Accords

NASA, in coordination with the U.S. Department of State and seven other initial signatory nations, established the Artemis Accords in 2020. Now with more than 60 signatories, the Artemis Accords provide a common set of principles to enhance the governance of the civil exploration and use of outer space as many countries and private companies conduct missions and operations around the Moon.
